Discussion:

Piotr's 5/24/2013 7PM - 7 AM Shift summary: It has been wet past 11 hours at NPOL. First at around 8PM local time a line of light precipitation moved from the north-west followed by a number of spotty showers over the Upper Cedar, Turkey and the instrumented line towards Iowa City. NPOL and D3R collected a good amount of data in RHI mode when waves of convective, isolated cells rushed from the west. In the morning, more widespread and stronger precipitation advances from the west. NPOL continues IFLOODS_RAIN + IFLOODS10_RHI scans. D3R scans over the 130.4 deg line (RHI + a 1- deg sector).
